Bright Copper Finish

This Bright Copper Finish displays a high quality look that is predominately associated with Copper. The aesthetic appeal of this quality finish takes affect as the surface slowly develops a typical patina when exposed to the atmosphere.

Pre-Weathered Finish

The Pre-Weathered Finish has been developed to bridge the time period from the Bright Copper Finish to a brown oxidised layer even before the cladding is laid. This is not an artificial colouring process or coatings, but rather an oxidised layer, which is created from the surface of copper itself. The surface further develops it's patina in the course of normal weathering.

Patina Finish

The bluish green colour present on pre-Patinated copper is similar to the natural Patination that occurs over a long period of time when copper is exposed to atmospheric conditions. This finish provides the attractive look of copper's unique patina green right from the start. As a result of the manufacturing technology used, individual sheets can vary in colour from light green to blue-green. When exposed to further weathering, the patina continues to develop. Colour changes in the patina are a sign of development, emphasising just how natural the surface is.
